

1. Brief Introduction of The Game Concept

The game's main theme is piracy, telling the story of a small seafaring crew and their adventures across a map filled with pirates. The main characters are our captain and his helper, a sailor. The captain also has a parrot. While this crew is traveling on a small ship, their ship gets damaged due to bad weather conditions, and they end up stranded on a lost island. While our crew tries to survive on the island they have crashed on, they both explore the island and discover things on it that send them on a journey. The journey that begins this way takes our crew on an adventure where they will set foot on many lands.

2. Gameplay mechanics for the first 50 levels (Obstacles, Power-Ups, and Boosters)

2.1 Obstacles

In the first 50 levels of the game, there are 6 different obstacles. The obstacles are classified using the property framework defined in Section 0.2, with two additional properties introduced specifically for this game:

Fragile: The obstacle cannot be cleared by an adjacent match, but it breaks when hit by a power-up. Its intended collection method (such as reaching the bottom row by gravity) only works when the obstacle is still intact, so breaking it with a power-up means losing that collection chance.

Direction-Conditioned: The obstacle reacts only to adjacent matches made from a specific direction. Matches from any other side have no effect.

The 6 obstacles introduced within the first 50 levels of the game are listed below.

Name	Unlocks at Level	Definiton & Type
		• Stays in place without being affected by gravity. • When an adjacent match is made next to it, the knot unravels and the obstacle is cleared. • Occupies 1 grid tile.

Rope Knot	Level 2	- At Level 4, a 2-health Rope Knot is introduced (Tier 2), which requires two adjacent matches to fully unravel; the first match loosens the knot visually, and the second one clears it. - Stationary - Blastable - Single-Match
Seaweed	Level 5	- Sits front the match items as a small seaweed layer and never affects gravity or cube movement. - Cleared by making a match on top of it. - Occupies 1 grid layer. - At Level 7, a 2-layer Seaweed is introduced (Tier 2), which requires two matches made on top of it to be fully cleared; the first match thins the seaweed visually, and the second one removes it. - Stationary - Blastable - Layered
Bottle	Level 11	- Affected by gravity and falls down whenever there is empty space below. - The player must carry it down to the bottom row of the grid in order to collect it. - It cannot be cleared by adjacent matches, but it breaks when hit by a power-up. - Extra bottles will fall to the grid if needed to fulfill the goal - Moving - Fragile - Collect by Gravity
Compass	Level 21	- The Compass points to a specific direction and can only be cleared by an adjacent match made from that direction. Matches made from any other side have no effect on it. - The Compass changes its direction randomly every 3 moves. - The Compass cannot point directly toward an obstacle or the boundary of the grid, since a match from that direction would be impossible. - Direction only matters for adjacent matches; when hit by a power-up, the Compass takes damage regardless of the direction. - Occupies 1 grid tile. - Stationary - Blastable - Direction-Conditioned
		- Sits stationary on the grid and releases one Pirate Gold every time an adjacent match is made next to it, until all required Pirate Golds are collected. - Occupies 1 grid tile.

Chest	Level 31	- At Level 36, a Tier 2 version (Chest + Key) is introduced, in which the Chest starts closed and must be unlocked by a Key. - The Key spawns higher up in the same column as the Chest and falls down with gravity. When the Key reaches the Chest, the Chest opens, and from that point on it releases one Pirate Gold per adjacent match exactly like the Tier 1 version. - The Chest and Key must always be placed in the same column. - Stationary - Collectible - Multi-Match
Flagpole	Level 41	- A vertical 1×3 obstacle holding a single-colored flag. The player must make an adjacent match in the matching color to raise the flag one step. - After 3 same-colored adjacent matches, the flag reaches the top of the pole and the obstacle is cleared. - Matches of incorrect colors have no effect on the flag. - At Level 46, a Tier 2 Double Flagpole is introduced: a 2×3 obstacle holding two flags of different colors side by side. Each flag must be raised independently by adjacent matches of its own color (3 matches per flag), and the obstacle clears only when both flags reach the top. - Stationary - Color-Conditioned - Multi-Match

2.2 Power-Ups

The game features four different power-ups, each created by blasting a group of same-colored cubes that meets a specific size or shape condition. Power-ups spawn at the position of the tapped cube that triggered the blast, and they are activated either by tapping them directly or by being triggered through chain reactions with other matches and power-ups. When two power-ups are combined, they produce stronger effects (covered in detail in the Combo section). The four power-ups can be seen in Figure below.

Name	Creation Condition	Definition
Pufferfish	4 same-colored cubes in a 2×2 square	- The Pufferfish is a passive, color-bound power-up that the player cannot activate directly. It is created in the color of the group that formed it and stays on the grid as a placed object. - Whenever a cube of its own color ends up adjacent to it, the Pufferfish puffs up and bursts; destroying itself, that cube, and any other same colored cubes connected in a chain to the trigger cube. - The Pufferfish also reacts to obstacles: if any obstacle ends up adjacent to it, the Pufferfish bursts and deals damage to that obstacle, regardless of the obstacle's color or direction condition. However, Fragile obstacles such as the Bottle are an exception; the Pufferfish does not react to them, since breaking a Fragile obstacle would cost the player their collection chance. In this sense, the Pufferfish always acts in the player's favor. - If the Pufferfish is not triggered within 4 player moves after its creation, it just explodes without dealing any damage.
Anchor	5 or 6 same-colored cubes in a single group	- The Anchor is a two-directional power-up with arrows pointing to opposite sides, indicating which row or column it will clear when activated. - Its direction is determined randomly at the moment of creation and stays fixed until activation. When triggered, it clears every item along its row or column. - However, if the group forming it is shaped like an L (5 or 6 cubes), the two anchor directions point at a 90 degree angle to each other. For example, one arrow points left and the other points up. When activated, the Anchor clears items only along the two directions its arrows point to, producing an L-shaped sweep from its position. - In either case, it deals one damage to any obstacle in its path.
Barrel	7 or 8 same-colored cubes in a single group	When activated, the Barrel explodes outward in a diamond-shaped pattern, clearing every item up to 2 tiles away from its position in any direction. The explosion affects 13 tiles in total, forming a diamond shape rather than a square area.
Octopus	9 or more same-colored cubes in a	The Octopus is the most powerful single power-up in the game. It is created in the color of the group that formed it, and when activated, it clears every cube of its own color across the entire grid.

	single group	
--	--------------	--

When two active power-ups are placed next to each other and one of them is tapped, they combine to produce a stronger effect than either power-up could create on its own. The Pufferfish is a passive power-up and does not take part in combos; it only triggers through its own trigger principles. The combos available between Anchor, Barrel, and Octopus are explained table below.

Combo	Definition
Anchor + Anchor	The two Anchors merge at the tapped position and unleash a cross-shaped sweep, clearing the entire row and the entire column from that position without looking anchors' directions.
Anchor + Barrel	The two power-ups combine at the tapped position and clear 3 full rows and 3 full columns centered on that point, forming a wide cross across the grid.
Barrel + Barrel	The two Barrels merge into a single larger Barrel that detonates with a much wider diamond-shaped explosion, clearing every item up to 4 tiles away from the tapped position in any direction. All obstacles in the area take one damage.
Octopus + Anchor	The Octopus turns every cube of its color into an Anchor, and all those Anchors activate one after another, sweeping the grid in a chain of row and column clears.
Octopus + Barrel	The Octopus turns every cube of its color into a Barrel, and all those Barrels detonate one after another in their diamond-shaped pattern. The combined effect clears most of the grid and heavily damages all obstacles in the affected areas.
Octopus + Octopus	The two Octopuses combine into one massive Octopus that wraps its tentacles around the entire grid, clearing every cube and damaging every obstacle on the board by one.

2.3 Boosters

The game has four in-game boosters that unlock as the player progresses through the levels. Each booster is themed around an object from the pirate and sailing world, so that its function can be guessed just by looking at it.

Name	Definition
Pirate Hook	Clears the selected single item or gives one damage to the selected obstacle.

Side/Bow Cannon	• Clears all items in the selected row/column. • When this power-up is tapped, two options appear right above the power-up button, allowing the player to choose between the Bow Cannon and the Side Cannon.
Bombardment Ship	• Throws pirate grenades to the three positions on the grid where they can deal the most damage, and each grenade affects a 3×3 area.
Parrot	• Shuffles all cubes on the grid.

Alongside these in-game boosters, Pre-Chosen Power-Ups unlocks when the player progresses levels. From that point on, the player can start any level with one or more pre-placed power-ups chosen from the Anchor, TNT, and Octopus. Three of each are given to the player as a gift when the feature first opens, and once these are used up, more can be purchased with gold.

3. Concept Ideas for Basic Match Elements, Power-Ups, Boosters, and Obstacles

3.1 Basic Match Elements.

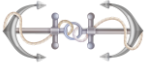

The game features five different match items, each represented by a distinct themed object and a distinct color. Following the same design logic used in Toon Blast, the match items are differentiated not only by color but also by silhouette and icon, allowing the player to instantly recognize each item even at a glance. To remain consistent with the visual conventions of established tap-to-blast titles the match items are designed as cube shaped objects. This shape choice immediately signals the game's tap-to-blast nature to the player from the very first screen.

In line with the pirate and sea theme, the five match items are illustrated as objects that belong to the world the player explores:

Color	Icon	Visual Concept
Red	Pirate Hat	• A classic tricorn pirate hat
Blue	Sea Wave	• A small curling wave, reinforcing the marine theme
Green	Palm Leaf	• A palm leaf that combines with the green color to evoke the island's tropical atmosphere while keeping the visual fresh and light.
Yellow	Gold Coin	• Gold representing treasure and reward.

Purple	Skull	A small cartoon style skull, hinting at the mysterious tone of the journey.
--------	-------	---

3.2 Power-ups

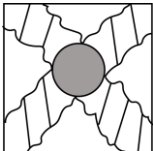

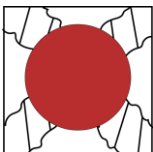

Reference Visual	Name	Concept Rationale
	Pufferfish	The pufferfish is a sea creature that puffs up when it feels threatened. This behavior maps directly onto the power-up's mechanic, which triggers when a same colored cube or a obstacle comes next to it. The player can intuitively understand what it does just by looking at the object.
	Anchor	The anchor is one of the most fundamental objects in the sailor world. Since it's an object that gets thrown out from the ship, using it as a power-up reasonable.
	Barrel	Barrels are a classic element on pirate ships. Because the barrel is already associated with explosions, its outward-spreading clearing effect feels familiar and readable for the player.
	Octopus	The octopus appears in pirate stories as a legendary creature. With arms reaching everywhere, it fits naturally as the most powerful power-up, which clears every cube of its color across the entire grid.

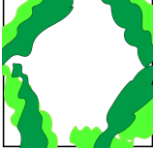

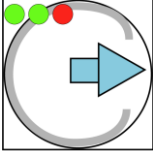

3.3 Concept Ideas for Boosters

Visual	Name	Concept Rationale
	Pirate Hook	The hook is one of the iconic objects of the pirate world. It serves as a fitting visual match for a booster that interacts with a single item or obstacle with hitting on it.

	Side/Bow Cannon	Cannons mounted on the sides and bows of pirate ships fire outward to the left/right and up/down. This logic maps directly onto a booster that clears a row or column.
	Bombardment Ship	Cannons mounted on the bow of the ship fire forward. This fits naturally with a booster that clears a column.
	Parrot	The parrot is the classic companion of pirate captains. As a bird that flies around and creates chaos, it works as a fitting object for a booster that shuffles the grid.

3.4 Concept Ideas for Obstacles

Reference / Sketch Visual	Name	Concept Rationale
Reference:  Sketch:  Tier 1  Tier 2	Rope Knot	A pirate ship is held together by ropes and knots, so the knot felt like the right object for the very first obstacle. The player picks up on the theme from the first move. The "unraveling" visual when you make a match next to it also fits the single-match logic nicely.
Reference:  Sketch:  Tier 1	Seaweed	The crew is stranded on a lost island in the opening chapters, so seaweed fits the theme; it's the kind of thing they need to be cleared out of their way as they explore the shore. It also pairs well with the Rope Knot

 Tier 2		visually since both are organic, which keeps the early game obstacles feeling like they belong to the same world.
	Bottle	The bottle is an object tied directly to the pirate and sailor theme. It's a familiar everyday item commonly found on ships, which is why it was chosen as an obstacle that helps the player connect with the theme.
Reference:  Sketch: 	Compass	- A compass already points somewhere by its nature, so the player can read the rule directly from the arrow; no long tooltip needed to figure out which side to match from. The mechanic is the visual. - There are also 3 green dots on the compass that act as a turn counter: each time the player makes a move, one dot turns red. Once all 3 dots are red, the arrow rotates to a new direction and the dots reset to green. This way the player can always see how many moves are left before the compass changes direction.

Reference:

Tier 1(unlocked chest)

Tier 2(Locked Chest)

Key for Tier 2

Collectible item:
gold

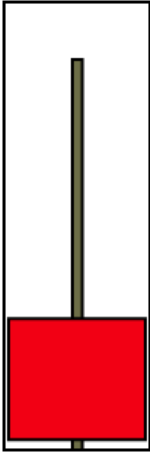

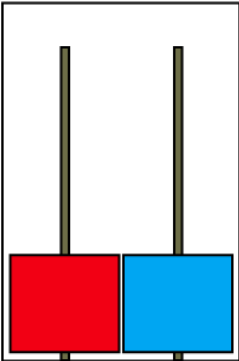

Chest

- Treasure chest is a core object of the pirate theme and fits naturally as a collectible obstacle. It carries a strong sense of reward on its own, which makes it a recognizable and satisfying obstacle for the player.
- For the Tier 2 version, the chest is illustrated with a prominent lock on the front, paired with a bright yellow key that stands out clearly on the grid.

Reference:

Sketch :

 Single-Colored  Multi-Colored	Flagpole	• Raising a flag is a win moment in pirate stories; claiming land, marking a ship. The mechanic mirrors that: each correct match raises the flag one step, so the player sees progress on every move.
---	-----------------	---

4.Meta Game Design

The meta-game part of the game is designed around concepts that feel as open as possible and stay connected to each other. The player progresses through certain level sections (for example, Levels 1-10) on specific islands. When the player first arrives on an island, most of the island is hidden and covered with clouds. As the player completes levels and returns to the main menu, the hidden parts of the island slowly become visible. The player earns one star for each completed level, and uses these stars to build things along the path they walk on the island, turning that island into an area they can keep using and revisiting. While the player progresses through the levels and uncovers the mystery of the island, building things on the places they have walked through gives them a sense of conquest, which creates a feeling of satisfaction. When all the levels of an island are completed, the main characters find a mysterious chest, and items such as boosters, power-ups, and gold come out of it, along with a unique collectible item special to that island. These items are gathered in the Collectibles section of the main menu, giving the player a collector's feeling. This both creates satisfaction and lets the player revisit and inspect the collectibles they have gathered whenever they want, providing a visual satisfaction as well. In

the first 50 levels of the game, there are 4 islands. Some example meta-game contents of these islands can be seen in the table below.

Name of The Island	Example of Buildable Products	Example Collectible Ideas
Lost Island	• Camp Fire (1 star) • Shelter (2 stars) • Fishing Spot (1 star)	○ A Quarter of Map Fragment
Ancient Jungle	• Jungle Path (1 star) • Water Well (2 stars) • Bridge over Stream (3 stars)	○ Ancient Stone Tablet ○ Captain's Old Compass
Rocky Shore	• Lighthouse (2 stars) • Watchtower (2 stars) • Wave Breaker (2 stars)	○ Pirate's Lost Medallion
Twist Island	• Beach Camp (1 star) • Build Sun Clock (2star)	○ Captain's Journal ○ Another Quarter of Map Fragment

5. Level Design Strategy

When designing the levels of the game, the design should pull the player into the game as much as possible. As mentioned in the Toon Blast and Royal Match sections above, the obstacles and grid types we have should be distributed across the levels in a way that creates a unique feeling in each one. Obstacles should be introduced one by one through easy levels so that the player gets used to these mechanics. As new obstacles are added, they should be combined with each other, both to give the player a greater sense of achieving something while playing and to let the player's hands get used to the mechanics. While designing these levels, rising and falling difficulty curves will be used in certain sections, as is done in many games. As the levels progress, the game gets harder, but to prevent the player from getting frustrated, this difficulty level will increase in a wave-like pattern. While the grid types described in the framework will be used, the early levels will mostly use simple grid types so that the player gets used to the other mechanics. As different grid types are slowly shown to the player, care will be taken to make sure the player does not get stuck on any level; these levels will be more in a teaching role.

For the first levels of the game, it will used a simple but instructive level design that we often see in other blast and match games. This will feel familiar to people who play these blast games and they will grasp the mechanic easily, while for those who do not usually play this type of game, it will be a section they can pass through

without difficulty. While the box obstacle is commonly used in similar games and creates a similar look in every game, the rope obstacle used here with a very similar logic will feel visually different to the player while pulling them into the game through similar mechanics and design.

When each island is finished, a minigame will appear in order to visually show that the team is moving to the next island. In this minigame, we will open the right paths for our ship that wants to move forward through the sea current and help it find its way out. This will give the player a sense of relief and a visual satisfaction at the end of each section. The name of these levels will be "Leaving the Island" and playing them will not be mandatory.

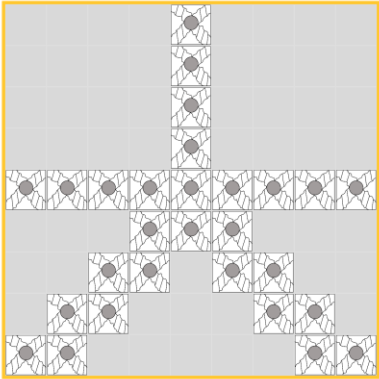

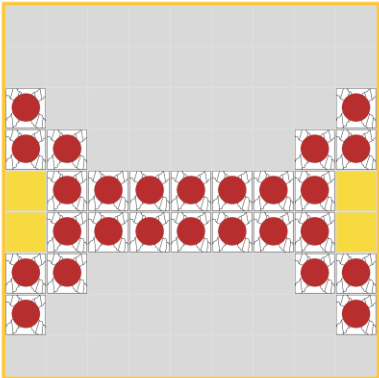

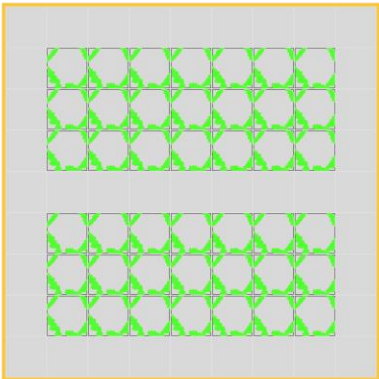

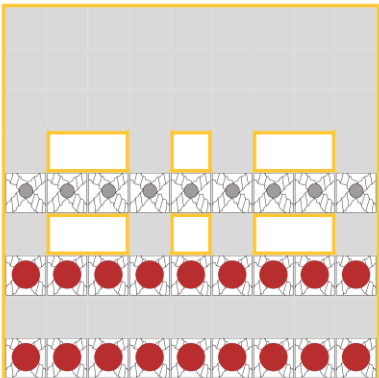

To make the level designs easier to understand and follow, they are divided into four categories: Introduction & Tutorial Levels, Combination Levels, Challenge Levels, and Single Obstacle High Target Levels. These categories are examined below in order, with example levels shown for each. Each example level is presented with an estimated move count and goal number; however, to get a full insight into these values, the levels would need to be tested in practice. After these parts, a few minigame level designs will be shown.

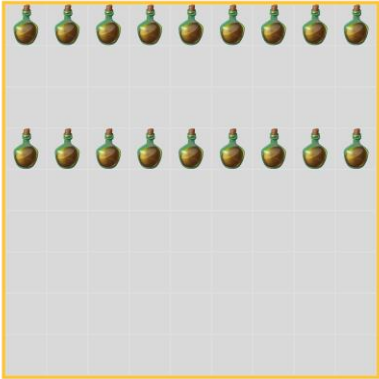

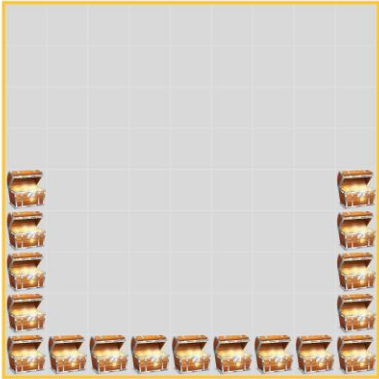

Note: In the levels, the colored squares shown in a single solid color represent the match cubes in the game. If a grid tile is not marked with a specific color, it can be random; if a color is specified, it has been placed intentionally.

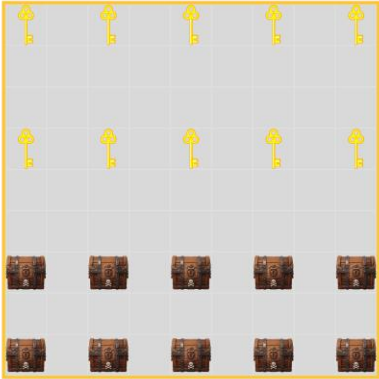

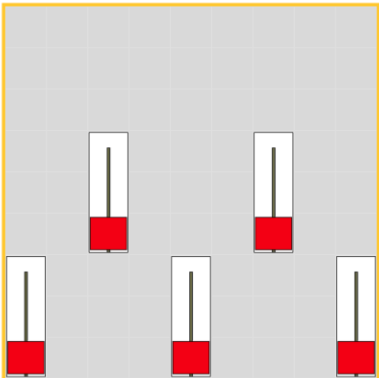

5.1 Introduction & Tutorial Levels

These levels are where new obstacles are introduced and the player is given plenty of move freedom. They introduce the first version of each obstacle and sometimes also include their second phase. To avoid frustrating the player, these levels are generally designed with simple geometric shape grid types, while small notched grids are occasionally used so the player can also get used to that layout. Some concept levels designed in this style can be seen in the tables below.

Concept Level Visual	Moves	Goals	Definition Notes
----------------------	-------	-------	------------------

	26	28 Rope Knot	• Introductory • 1 Health Rope Knot
	30	26 Rope Knot	• Introductory • 2 Health Rope Knot
	28	42 Seaweed	• Introductory • Seaweed
	21	27 Rope Knot	• Introductory • It aims to show player how notched in the grids reacts at a easy level.

	32	42 Bottle	Introductory
	26	17 Compass	Introductory
	28	36 Pirate Gold	Introductory

	24	18 Pirate Gold	• Introductory • Chest + Key version of Chest
	19	5 Flag	• Introductory

5.2 Combination Levels

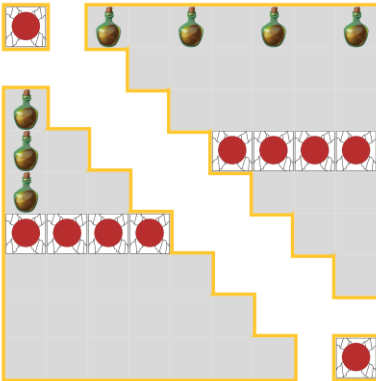

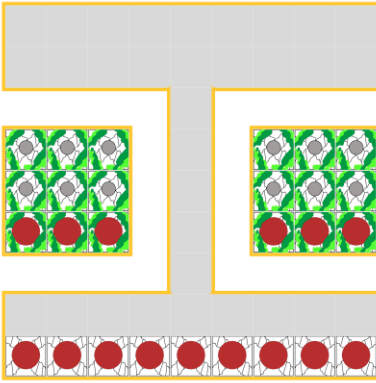

These levels are not designed to be very difficult, but they bring a few obstacle types together so the player can understand how to deal with these kinds of combinations. They are relatively harder than the introduction levels and sometimes use different grid types to give the player a unique level feel. Some concept levels can be seen below.

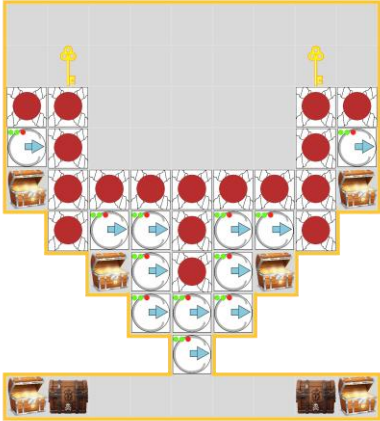

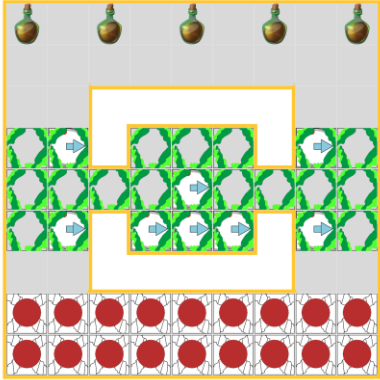

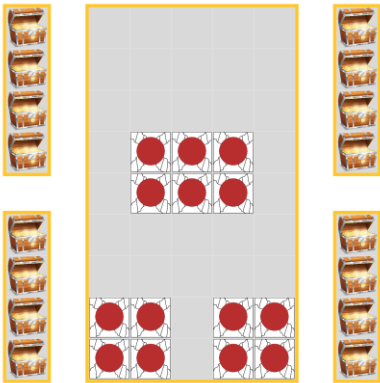

Concept Level Visual	Moves	Goals	Definition Notes
	25	27 Rope Knot 49 Seaweed	Relatively easy compared to the combine levels, this is a medium-difficulty level that shows how to combine different obstacles in a simple geometric grid.
	17	16 Rope Knot 24 Bottle	A relatively easy level that splits the grid into four separate sections, giving the player a sense of visual symmetry and satisfaction while teaching them how to deal with grids structured this way.
	26	18 Rope Knot 6 Seaweed 12 Bottle 16 Pirate Gold	Although the level looks easy due to its geometric grid type, the necessary difficulty can be achieved through move restrictions and goal numbers.

	34	28 Rope Knot 9 Seaweed 18 Pirate Gold	With its distinct grid structure and obstacle placement that disconnects the grid areas from one another, this level both demonstrates what combination levels can offer and hints at what may come in the upcoming levels.
	22	17 Rope Knot 12 Compass	A level that fills most of the grid area with obstacles to restrict the playable space, while combining two types of obstacles to deliver an enjoyable gameplay experience.
	17	9 Rope Knot 5 Compass 16 Pirate Gold	With its symmetric grid structure, this level provides a relatively readable gameplay flow, while bringing multiple obstacles together to deliver both visual satisfaction and a teaching purpose.
	15	6 Compass 2 Flag 12 Pirate Gold	This level mixes a few obstacles together on a simple geometric grid, offering a relatively easy gameplay experience while serving as an instructive stage for understanding how obstacles combine with each other.

5.3 Challenge Levels

These level structures are designed to challenge the player as much as possible and push them to think carefully. In these levels, many different obstacle types are used along with a variety of different grid types. While using these grid types, they are combined with obstacles in a thoughtful way to create certain restrictions for the player, which both makes them think harder and gives them a strong sense of satisfaction when they clear the level. These levels also play an important role in the monetization strategy.

Concept Level Visual	Moves	Goals	Definition Notes
	26	10 Rope Knot 25 Bottle	This level is a challenging one in which the grid is divided into as many sections as possible and obstacles are placed in hard-to-reach or unreachable areas, forcing the player to create and use power-ups.
	22	27 Rope Knot 18 Seaweed	This level also uses a split grid and places obstacles in hard-to-reach areas, pushing the player toward using power-ups. Although the obstacles are not placed as restrictively as in the above level, the

			grid structure itself makes creating power-ups difficult and will challenge the player.
 A 10x10 grid with a central 6x6 area of red circles. The top row has two yellow keys. The bottom row has four gold chests. The middle section has a path of blue arrows leading from the top to the bottom.	32	17 Rope Knot 12 Compass 20 Pirate Gold	In this level, different types of obstacles are combined with each other, and in order to reach certain obstacles, the player must first get past other obstacles and also reach specific areas of the grid.
 A 10x10 grid with a central 6x6 area of green circles. The top row has five gold bottles. The bottom row has a solid row of red circles. The middle section has a path of blue arrows leading from the top to the bottom.	27	18 Rope Knot 8 Compass 14 Bottle	This level challenges the player's thinking with the compass obstacles placed in the open area in the middle, while the high number of other obstacles adds to the difficulty of the experience.
 A 10x10 grid with a central 6x6 area of red circles. The top and bottom rows have four gold chests each. The middle section has a path of blue arrows leading from the top to the bottom.	24	14 Rope Knot 28 Pirate Gold	This is another level that forces the player to rely on power-ups.

	28	9 Compass 3 Flag 21 Seaweed 16 Pirate Gold	In this level, a large number of obstacles are used, and the grid is cut at multiple points to make power-up creation more difficult, while the obstacles are placed in layers to make them relatively harder to reach.
	19	13 Rope Knot 12 Seaweed 3 Compass 5 Flag	In this level, the flagpole obstacles are placed in the corners to make them harder to reach, and a layer of obstacles is formed above them to further restrict access. Additionally, a rectangular hole is left in the upper part of the grid, making power-up creation more difficult.

5.4 Single-Obstacle High-Target Levels

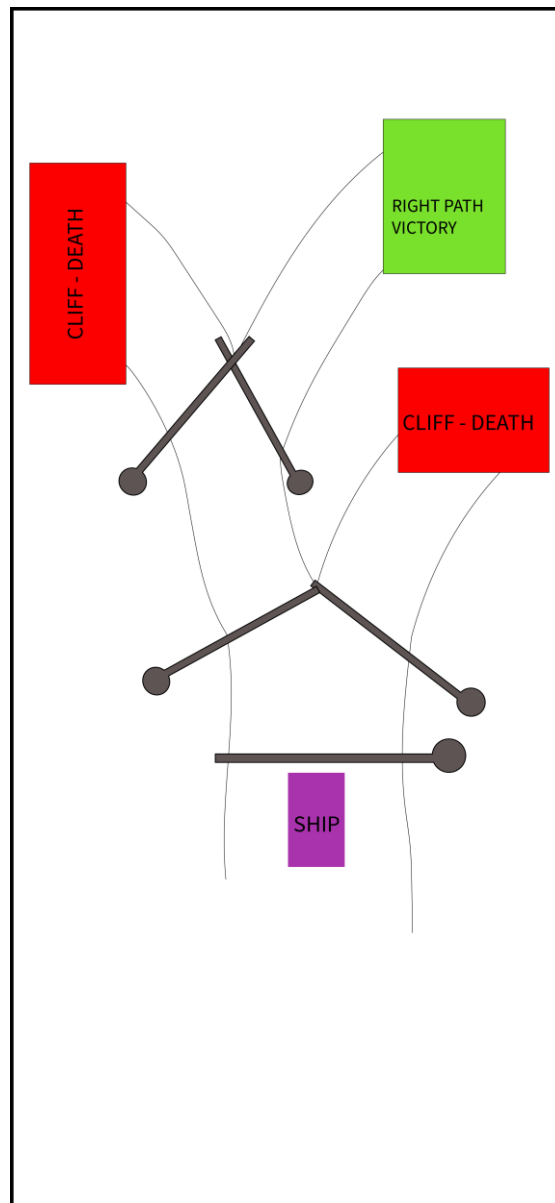

These levels consist of only one type of obstacle but require the player to collect a large amount of that obstacle. The grid layout is generally designed in a simpler way, allowing the player to make moves more comfortably and giving the level a visually satisfying feel through the high amount of collection that takes place. However, despite how they look, these levels don't have to be easy. By balancing the move count and the required goal amount properly, the aim is to both give the player a visually satisfying experience and sometimes put them through challenging moments. A few concept level examples can be seen below.

Concept Level Visual	Moves	Goals	Definition Notes
----------------------	-------	-------	------------------

	32	95 Bottle	With the grid kept wide open to make power-up creation easier, the collection of fragile obstacle types becomes more challenging, resulting in a level that is both relatively difficult and satisfying due to its high goal count.
	34	150 Pirate Gold	Although this is a relatively easier level, the grid tiles near the obstacles are intentionally left as holes to make them harder to reach, resulting in a level that is both thought-provoking and satisfying to complete.

5.5 Mini Games

Unlike the core game mechanics, the mini games consist of simple puzzles that represent the ship's escape from the island. In these puzzles, the player must clear the obstacles in front of the ship in the correct order, guiding the ship through the current toward the right exit. As a reward for completing these minigames, the player receives a small amount of gold. An example of a minigame can be seen in the figure below.

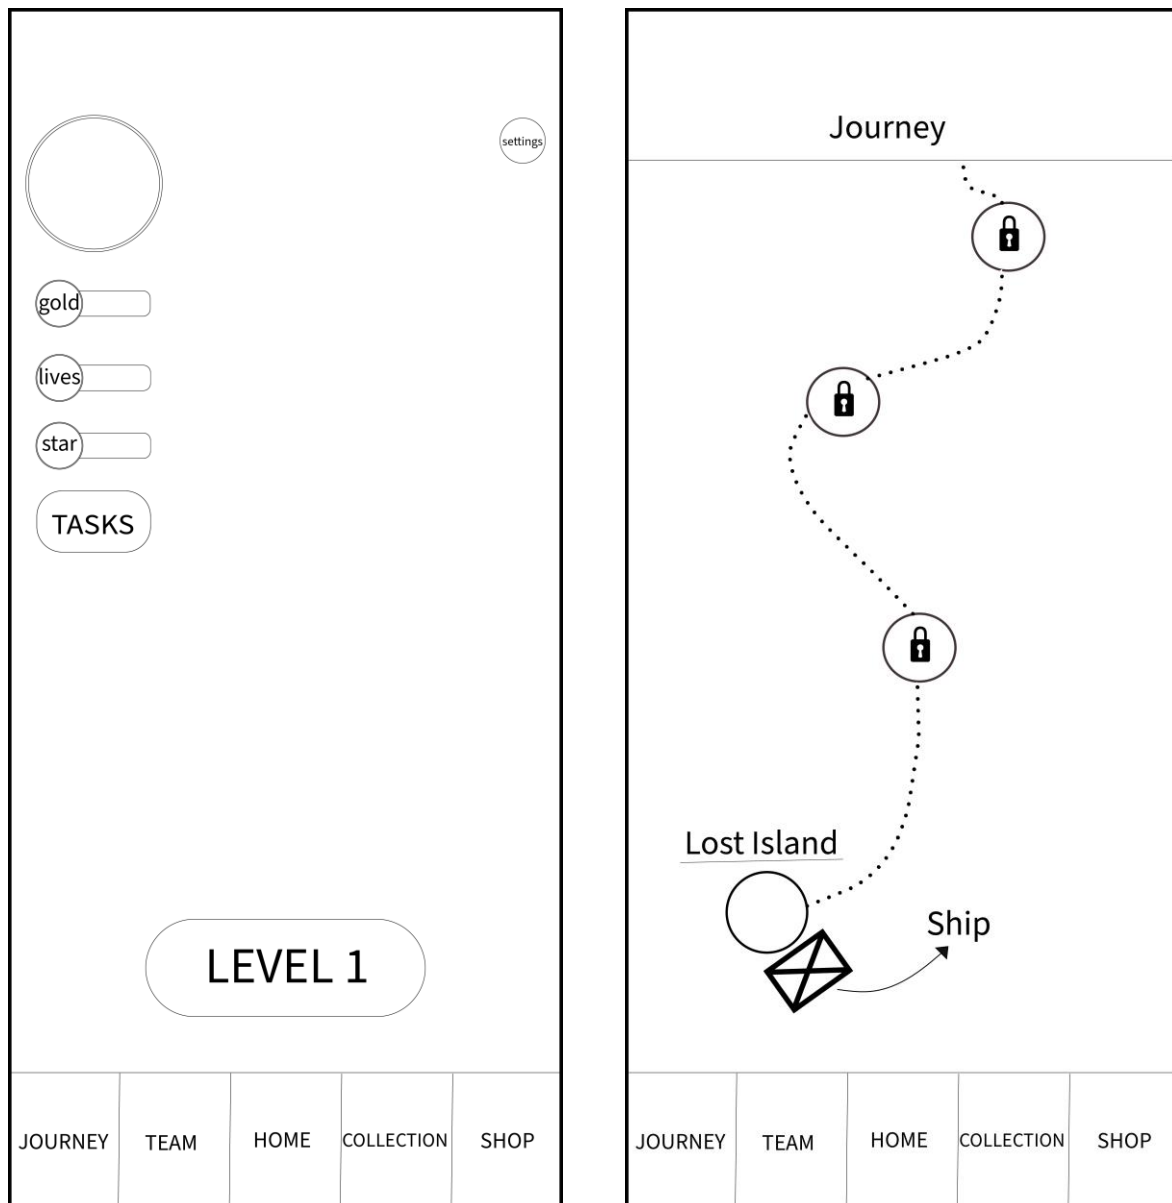

6.Home Screen UI Design and Gameplay Screen UI Design

The home screen and in-game screen were designed with the goal of creating an interface that feels as open and uncluttered as possible. As described in the Meta-Game Design section, the player sees the island they are currently on in the main menu and sometimes builds certain objects on it by completing tasks. For this reason, the indicators on this screen are grouped on the left side, leaving the top and right side of the screen as open as possible. In addition, information such as the player's profile, gold, and tasks is gathered on a single side, creating a dedicated area where the player can check their information at a glance. Also settings button placed right of the top screen apart from these indicators.

These indicators/buttons are also placed slightly below the top edge of the screen, so that in later stages of the game a thin, long panel showing collected items from events and similar features can be added in that space. The areas are labeled with text to indicate which buttons they represent.

When the Journey button on the main menu is tapped, the player can see the islands ahead on their journey from a distance, and once an island is completed, they can tap on it to revisit that area. The wireframe UI drawings of both the menu screen and the Journey screen are shown in the figure below.

The in-game screen was also designed to feel as symmetric and open as possible. The top panel contains, from left to right, a section with the character's animations, a section with the goals, and a section showing the move count. The goals section is placed in the middle of the panel because the focus should be drawn to how many

more items the player needs to collect while playing. The character animation panel placed on its left supports the gameplay with animations that make it more enjoyable. Under the moves section, in addition to the remaining move count, the player's current level and the number of lives they have are also shown. This helps the player get a better sense of whether they should take a risk, use a booster, or get an extra moves on a level they're struggling with.

The game area (grid) is placed exactly in the middle of the scene to keep the player's focus on the gameplay. At the bottom of the screen, there are four booster buttons and a settings button. The booster buttons are designed in a rectangular shape while the settings button is designed in a round shape, making them easy to tell apart. Also, no background panel was added behind the buttons in this bottom section, so the main game screen doesn't feel crowded. The wireframe UI drawing of the in-game screen can be seen in figure below.
